

Standalone Field Operations

In the event that there is not temporary or permanent AC power on your site, our camera systems can quickly be installed to run on solar power. The simplest and quickest way to place a camera on a project is with the Mobile Video Tower (MVT). These self-contained power units are great for any type of location.

The MVT is solar-powered and holds a charge for at least 10 days during overcast weather. The trailer is small enough to fit in a parking spot and light enough to be moved by hand. Set up only takes 5-10 minutes and once the power is switched on, video recording begins instantly.
