ePlanIt to Debut Project Management Technology at the International Builders Show

Frisco, TX --- Sept. 20, 2007--- ePlanIt will demonstrate its next generation construction and jobsite management service at the Orlando International Builders Show, 2008. Their suite of products utilizes the latest in wireless Internet cameras, GPS, and powerful web based administrative software to provide a complete and cost effective solution for construction and jobsite management. ePlanIt has integrated project collaboration, document sharing, live interactive scheduling, GPS labor tracking and self-powered mobile Internet camera towers into a single web based solution. Plans and documents, daily reports, jobsite video, and project status are instantly available for everyone from developers and general contractors to architects and subs contractors.

At the center of their construction management technology is ePlanIt Project™, a comprehensive software toolset for general contractors, developers, and sub contractors that is delivered as a secure on-demand web service. Live imagery from their mobile video towers and real-time, GPS tracked, labor reports are seamlessly integrated into ePlanIt Project™. ePlanIt's president, Ron Toupal states "We've designed ePlanIt Project to be a scalable construction management system that brings together all the information you need to manage a project into a configurable online software environment that's inexpensive and easy to use."

ePlanIt's rugged mobile video towers are designed specifically for construction sites and use the latest in high-resolution cameras, wireless Internet, solar power, and digital video recording software. Each camera tower is trailer mounted, stabilized, and requires no external connections for full operation. The towers can be set up on a jobsite in less than an hour and moved quickly and easily.

Another key feature of ePlanIt's technology is a GPS labor tracking service that provides accurate real time data about a work force and eliminates overbilling and paper time sheets. Workers are automatically clocked in and out of project jobsites and their times are sent directly to a customer's ePlanIt Project™ website where a wide range of project and labor reports can be created and compared to construction schedules. Supervisors can also track individuals, vehicles, and equipment by viewing their positions and routes on interactive maps.

EplanIt Inc. is based in Frisco, Texas and provides a variety of next generation technology solutions to the construction industry. More information about ePlanIt and their services can be found online at www.eplanit.com or by contacting Tim Adkison at 214-472-3413.
